STRENGTHENING NURSING AND MIDWIFERY
EUROPEAN STRATEGIC DIRECTIONS TOWARDS HEALTH 2020 GOALS

1 INTRODUCTION

Nurses and midwives have key and increasingly important roles to play in society’s efforts to tackle public health challenges in our time and in delivering safe, high quality effective and efficient health services. These professions are vital to protecting and improving health through supporting people to manage their own health and ensuring access and continuity of care when patients need it. This dual approach is central to meeting changing healthcare needs.

**Strengthening Nursing and Midwifery: European strategic directions towards Health 2020 goals** (ESD) aims to guide Member States in enabling and enhancing the contribution of nurses and midwives to achieving the Health 2020 goals of improving the health and well-being of populations, reducing health inequalities, strengthening public health and ensuring sustainable people-centred health systems. ESD builds on the values and principles endorsed in the *Health 2020: European policy framework and strategy for the 21 century* and outlined in the global *Strategic Directions for Strengthening Nursing and Midwifery Services 2011–2015*.

ESD is a framework to strategize action – the first of its kind in the WHO European Region. It sets out how to maximize nursing and midwifery potential and enable their full contributions for supporting Health 2020 implementation with clear action lines. ESD identifies 12 objectives, four priority areas of action and four enabling mechanisms that align policy and practice with Health 2020 vision and help Member States to strengthen nursing and midwifery within the context of their own country plans (see Section 4). Appendix 1 and 2 present a suggested plan of work by which Member States and stakeholders can engage in the work of the WHO Regional Office for Europe in the implementation of actions to deliver the objectives.

2 HEALTH TRENDS AND CHALLENGES IN THE WHO EUROPEAN REGION

Wide variations exist in the patterns of health and disease in the 53 Member States of the WHO European Region. While positive health gains have been reported in the last 20 years, not all countries have benefited to the same extent. Health-related inequities exist between and within countries and populations according to ethnicity, gender, socio-economic status, educational level and geographical area. In 2012 the infant mortality rate in the poorest countries in the Region was nine times higher than that in the richest. Whilst wider determinants of health e.g. social factors and education are biggest factors affecting health outcomes and inequalities, health care and thus supply of health care professionals is a significant contributor. Health workforce maldistribution and shortages are clearly associated with poor health outcomes. This situation is exacerbated by the growing problem of health workforce mobility and migration in many countries across the world, including many European countries, which can lead to a strain on services.

Noncommunicable diseases are the leading causes of mortality and morbidity in the Region and account for 86% of deaths and 77% of the disease burden. Cardiovascular diseases and cancer are the main killers, with disadvantaged populations displaying the highest prevalence and mortality. Mental health disorders are also on the rise and are among the most common contributors to chronic conditions in Europe. The current and predicted increase of older people is a particular challenge for the health and social sectors, requiring governments to support people to remain healthy and independent as late in life as possible. Furthermore,
preventing communicable diseases such as tuberculosis and HIV/AIDS and outbreaks of pandemics continue to be priority areas.

Primary health care remains a cornerstone of health systems in the 21st century. Recognizing patients as partners in their own care, extending supported self care and community based solutions require renewed emphasis on the need for effective primary health care. Primary care innovations need to include extending use of technologies for communication, decision support, remote health and care support (for example patients with chronic illness monitoring their own conditions and discussing results and actions with nurses on line). Integrated care is important providing best quality for patients and best value. Inter-professional collaboration in education, practice, and research is a priority and a means of fostering team work and mitigating the health workforce imbalances and shortages. WHO recognizes that inter-professional education in particular enables effective collaborative practice, which is a key in optimizing the skills of team members, case management and providing better health services which will lead to improved health outcomes.

The next decade is likely to be challenging for Member States due to the consequences of the international financial and economic crisis and continued problems of social exclusion, and health inequality. According to research on recent previous economic downturns, the main impacts tend to be on health and social issues, with poorer areas taking longer to return to previous levels.

3 TOWARDS A NEW ERA

3.1 Health 2020

*Health 2020*, the European policy framework for health and well-being, adopted by the 53 Member States of the Region in September 2012. It aims to support action across government and society to «significantly improve the health and well-being of populations, reduce health inequalities, strengthen public health and ensure people-centred health systems that are universal, equitable, sustainable and of high quality. Health 2020 builds on the previous ‘Health for All’ policies including *Health 21*, the *Tallinn Charter* and the *UN Millennium Development Goals*. Figure 1 presents four priority action areas of Health 2020. Strengthening people-centred health systems and public health is one of these action areas. The policy framework is also inextricably linked with the renewed emphasis on primary health care set out in the World Health Report 2008 *Primary Health Care, Now More Than Ever*. This action area is also a focus of the European action plan *Strengthening public health services and capacity*, as well as a focus on *people-centred health systems* which presents operational products and services under the programmes of the Regional Office.
Health 2020 supports integrated whole-of-government and whole-of-society approaches, as well as a global partnership in order to successfully address disease burden, and enable people to improve their health by tackling the determinants of health. Good health benefits all sectors through increased productivity and healthier ageing. Fostering collaboration with civil society and communities ensures health systems are person centred, comprehensive, accessible and integrated, and primary health care is strengthened. Health 2020 highlights nurses and midwives as having key roles to play in society’s efforts to tackle the public health challenges and in ensuring access to health services and continuity of care, as well as addressing people’s rights and changing needs.

3.2 Moving forward in the spirit of the Munich Declaration

The Munich Declaration: Nurses and Midwives: A Force for Health, 2000 was only the second WHO policy statement on nursing and midwifery in the WHO European Region endorsed by Ministers of Health. The first one, the Vienna Declaration on Nursing in Support of the European Targets for Health for All in 1988 focused on nurses and midwives’ roles in achieving the Health for All Target.

Health 2020 provides an opportunity for the Regional Office and Member States to re-engage with the sentiments expressed in the Munich Declaration, which recognize that nurses and midwives are a real force in public health and effective contributors within health systems. Despite the enormous social and economic changes over the past decade, the principles highlighted by the Munich Declaration continue to be just as relevant today.

Nurses and midwives deliver the highest proportion of direct patient/client care and have close contact with large numbers of the population. There are therefore clear benefits to nurses and midwives understanding the social determinants of health and being competent in the principles and practice of public health. Throughout the WHO European Region, the roles and scope of practice for all nurses and midwives should be focused on supporting optimal health of all ages and preventing noncommunicable diseases and/or the complications of noncommunicable diseases by means of health promotion; primary, secondary and tertiary prevention; and empowering people in self-care and changing their health behaviour. Some nurses and
midwives should also be educated as specialists in public health to work solely in this field alongside other public health specialists.

Nurses and midwives together form the largest group of health professionals in all countries and they are central to delivering safe, high quality effective and efficient health services. However, there is a wide variation between countries in composition of the health workforce, in education, regulation and the scope of practice for nurses and midwives.

Health policy priority areas regarding integrating health services and implementing the life-course strategy are setting new requirements for advanced nursing and midwifery practices. Nurse- and midwife-led services are being developed to provide equal and improved access and better continuity of care as well as improved health outcomes. Innovative roles such as the Family Health Nurse16, launched by the WHO Regional Office for Europe, is focused particularly on promoting and protecting people’s health throughout the course of their lives and reducing the incidence of and suffering from the most common and preventable diseases and injuries.

Nurses and midwives are recognized as essential members of multidisciplinary teams and interdisciplinary working in tackling social determinants of health, giving all children the best start, promoting health literacy, empowering self care, supporting healthy ageing and reducing health inequalities through the ‘Health for All’ approach. Inter-professional learning should be used to create a structured, supportive more nurturing climate for all professions to work in an integrated way for the benefit of patients and the community.

In recent years, several WHO resolutions17,18, and progress reports19,20 have recognized that improving and sustainable health service systems require educated, valued and properly rewarded nurses and midwives. The importance of a robust health workforce in the strengthening of health systems was recognized by the Regional Committee21 in Europe in 2007 and 2009.

There is a strong interconnection between Member States – this has been evident in the current financial crisis and extends to health policy and the impact of health policies across boundaries. This particularly applies to the health workforce and ultimate goal must be for Member States to have national health workforce sustainability.

There is evidence that healthy well supported, well educated and motivated staff improves the care experience and health outcomes. Therefore it is important to create positive work environments, career opportunities, professional recognition and rewards for nurses and midwives. This reduces sick leave and encourages their active engagement in the workplace and delivery of quality health services. Building health workforce capacity22 and reducing the brain drain of qualified health personnel from developing countries are supported by the WHO Global Code of Practice on the International Recruitment of Health Personnel23. Additionally health organizations which provide health promoting environments and health professionals with good health and well-being are role models in their communities for the value of health and well-being.

4 EUROPEAN STRATEGIC DIRECTIONS FOR NURSING AND MIDWIFERY

The common goal of Health 2020 and the ESD is to improve the health and well-being of populations and to reduce health inequalities. The purpose of the ESD is to guide Member States in enhancing the contribution of nurses and midwives to achieving the Health2020 goals. ESD aims to support Member States in strengthening and sustaining their nursing and midwifery workforces in order for these professions to ac-
tively contribute to improving health outcomes. This contribution reaches from providing care and protecting and promoting health and right through to national health policy and planning. ESD was created by the WHO Regional Office for Europe following extensive consultations from nursing and midwifery experts. ESD is built on the principles of the Munich Declaration, Health 2020 and the global Strategic Directions for Strengthening Nursing and Midwifery Services 2011–2015. The sentiments expressed in the World Health Assembly resolution on strengthening nursing and midwifery in 2011 and findings of the Global Survey on Progress in the Strengthening of Nursing and Midwifery in 2010 have also been taken into account.

The ESD outlines four priority areas of action, and 12 objectives underpinned by four enabling mechanisms to strengthen nursing and midwifery services within the context of Each Member State’s own country plans and in collaboration with the WHO Regional Office for Europe. The framework for the ESD is presented in Figure 2.

**Figure 2.** The framework for *Strengthening Nursing and Midwifery: European strategic direction towards Health 2020 goals*
Figure 2 shows how the ESD supports the implementation of Health 2020 through strengthened and sustainable nursing and midwifery workforce and services. The remainder of section 4 sets out information and suggested action lines to achieve the 12 objectives and ultimately contribute to the Health 2020 implementation. Each of the 12 objectives aligns with particular priority areas of action and enabling mechanisms which are presented in Table 1 and are detailed in this section. Appendix one shows a suggested framework for implementation between Member States and WHO Europe.

### 4.1 Priority areas of action

Based on consultations with experts in nursing and midwifery, four priority areas of action have been identified as necessary for supporting nurses and midwives in contributing effectively to the health of their communities. These priority areas of action are scaling up and transforming education and training, workforce planning and optimizing skill mix, ensuring positive work environments and promoting evidence based practice and innovation. Each will progress the Munich Declaration and significantly contribute to the realization of Health 2020 goals.
4.1.1 **Scaling up and transforming education and training**

**Priority:** The education of nurses and midwives is aimed at ensuring that a supply of qualified and competent nurses and midwives is available to meet changing population needs, health technology and health care delivery models.

**Objective 1:** Work to standardize initial education of nurses and midwives at degree level to get best outcomes for patients and population.

**Objective 2:** Develop education and regulation that enables and ensures that nurses and midwives core competencies are in line with the basic principles of Health 2020.

**Objective 3:** Strengthen continuing professional development and career development.

It is important that initial training of nurses and midwives promotes a commitment to evidence based practice, competence development and maintenance through engagement in life-long learning as integral component of on-going professional practice. Such life-long learning is not restricted to the academic setting and can be pursued through innovative learning models, such as virtual education.

Undergraduate and postgraduate curricula for nurses and midwives must provide for graduates who will be competent to meet the needs of a variety of patient groups and of changing health services\(^\text{24}\). Public health competencies should form part of core requirements in both undergraduate and postgraduate curricula in order to scale up health promotion and disease prevention competencies throughout the life-course. All curricula should address the key determinants of health, specifically a healthy start for all children, management of chronic conditions, long-term care, supporting healthy ageing as well as people empowerment and self-care.

Research indicates the degree level of nursing education and the patient to nurse ratio are associated with reduced preventable hospital deaths\(^\text{25}\). It is of utmost importance that patient safety, quality of care and the ability to apply evidence based clinical practice are central to nursing and midwifery professional education.

In order to enhance skills in collaborative teamwork and inter-sectoral cooperation, undergraduate nursing and midwifery programmes should be guided by the *Framework for Action on Inter-professional Education and Collaborative Practice*. For example, interdisciplinary education opportunities should be developed around specific health topics such as the management of non-communicable diseases.
4.1.2 Workforce planning and optimizing skill mix

**Priority:** A sufficient supply of nurses and midwives is central for ensuring the sustainability of healthcare systems and for enabling health systems to respond to the increasing pressure of changing demographics, and patterns of disease and to fully utilize current and future technologies.

**Objective 4:** Develop workforce planning strategies and policies to ensure a sufficient and sustainable nursing and midwifery workforce.

**Objective 5:** Ensure that workforce redesign and skill mix provides safe effective care.

Aligning supply with demand, now and into the future, requires effective workforce planning. At present, workforce planning methodologies, purposes, approaches and timeframes vary greatly between countries. Variations also exist among the professions and sectors included in these processes. Workforce planning should move from traditional uni-disciplinary models to multi-professional integrated workforce planning and ensure all relevant health professions – including nurses and midwives – are part of the planning process. National tools and planning processes can be informed and complemented by recent initiatives. Firstly, the WHO action framework for health workforce planning gives access to a range of models and tools. Secondly, the EU Joint Action on health workforce planning and forecasting provides a platform for information sharing and learning between countries. In addition, it is essential that Member States collaborate in contributing to the effective design and implementation of policy support tools such as the Human Resources for Health databases and the WHO Global Code of Practice on the International Recruitment of Health Personnel. Member States need to use accurate and complete data, appropriate methods and relevant tools to make evidence based decisions for the monitoring and planning of nursing and midwifery workforce. This not only informs the assessment of workforce demand, supply and mobility it also guides appropriate matching of skills with changing health needs.

Effective service delivery requires processes to ensure that there will be sufficient staff available at the right time, and with the right skill mix, competencies and flexibility to deliver high quality health care. There is a need for Member States to determine an appropriate skill mix between professions and occupations as a critical component of effective service delivery. Skill mix can refer to the mix of occupations, the demarcation of roles among different categories of staff and the combination of skills available or needed. Because health care is a labour intensive industry it is important to identify the most effective mix within available resources.

International literature provides a range of methodologies for determining the appropriate skill mix as part of a broader approach of resource planning. Reviewing data on skill mix, such as the mix between physicians and nurses/midwives or the mix between specialist and generalist physicians, can help inform strategies to ensure the most appropriate and cost-effective combination of roles and staff.

There is no universal ‘ideal’ mix of health personnel, but skill mix should be determined by identifying the care needs of a specific patient population. It is also important to examine organizational and system contexts which define the opportunity for change, such as introducing new roles or developing current roles. For example, evidence suggests that the scope of practice of nurses can be extended in many service systems based on patients’ and population needs and delivery of countries’ health reforms.
4.1.3 Ensuring positive work environments

**Priority:** Positive work environments have been shown to improve both patient and organizational performance outcomes.

**Objective 6:** Promote positive work environments.

There is evidence that healthy well supported well educated motivated staff improves the care experience and outcomes for patients. Therefore it is important to create positive work environments, career opportunities, professional recognition and rewards for nurses and midwives. This reduces sick leave to and encourages their retention and active engagement in the workplace and delivery of health care.

Positive work environments for nurses and midwives are defined as practice settings that maximize the health, safety and well-being of health workers and improve and/or sustain their motivation. Positive work environments ensure that nurses and midwives can conduct their work in a ways that are effective, efficient, safe and timely. Positive work environments thus impact positively on performance supporting good patient experience and outcomes, organizational performance indicators and contributing to wider societal outcomes. Financial benefits yield to organizations in terms of reductions in absenteeism, lost productivity, organizational health care costs and costs arising from adverse patient/client outcomes. Additionally health organizations which provide health promoting environments and health professionals with good health and wellbeing are role models in their communities for the value of health and wellbeing.

Governments have responsibility for legislation such as health and safety in the workplace and discriminatory treatment, to set national policy frameworks which support healthy work places and protect employees from bullying and harassment and to set expectations on staffing for high quality care.

Organizations have the responsibility to implement legislation and develop local plans and policies to meet national expectations and local needs and promote health and wellbeing and good work life balance for their staff. They are also responsible for ensuring occupational health services and work counselling need to be in place to assist with the emotionally straining and physically demanding work of nurses and midwives. Individuals are responsible for understanding and using policies to keep themselves and their patients safe, for taking responsibility for their own health choices and seeking help and support when needed.

Healthy workplace practice needs to be monitored and evaluated so that the information is be available to continuously improve working conditions through research and development. The prevention of work related injuries and the importance of healthy work environments must also be included in basic nursing and midwifery education.

The level of dissatisfaction expressed by nurses with respect to educational opportunities and career advancement is of major concern. Thus developing retention strategies is vitally important to ensure a sufficient and sustainable nursing and midwifery workforce. Prioritizing career development that improves patient care and increases participation in the development of the health services is essential. The opportunity to contribute as leaders to senior management overall service delivery decisions promote a sense of organizational loyalty. This can be achieved by organizational structures are in place to enable dispersed leadership and bring together multiple disciplines to share experience in development and governance.
Remuneration including appropriate salaries and contracts with flexibility is a basic requirement in terms of the retention of the nursing and midwifery workforce.

The demographic of the nursing and midwifery workforce is one of ageing. In addition to encouraging new entrants to the professions retention of the current workforce is a major issue and will require sustainable solutions, such as longer work careers and higher retirement ages. This will mean new roles for older nurses and midwives for example mentoring and different working practices and patterns\textsuperscript{34}.

4.1.4  Promoting evidence based practice and innovation

**Priority:** Healthcare should be delivered using the best available evidence to make decisions. This is important to promote the effectiveness of health services.

**Objective 7:** Facilitate the culture of evidence based practice in nursing and midwifery.

**Objective 8:** Develop, transform and adapt the roles of nurses and midwives in line with the goals of Health 2020.

Evidence based practice is every nurse’s and midwife’s concern. Evidence based practice must be enabled by means of education, research, leadership and access to the evidence sources. All Member States must strive to make it possible for their nurses and midwives to apply evidence based practice in their clinical roles. Applying evidence in decision making around patient care requires that nurses and midwives:

- use the best available evidence
- apply their clinical expertise and professional judgement
- recognize and incorporate patients’ needs and values
- effectively utilize available resources.

The goal is to provide the best possible care for patients and population on the basis of their needs. Furthermore, evidence based practice standardizes clinical care and strengthens the nursing and midwifery knowledge base.

Nurses and midwives have varied roles and responsibilities in line with organizational expectations as outlined in job descriptions/role profiles and in line with scope of practice. Different roles often require different levels of education, competencies and authorized scopes of practice. Health policy makers and leaders in nursing and midwifery must clearly identify these roles. A framework can be used as a tool to explain these roles in terms of their scope of practice, their expected competencies, and their responsibilities in disseminating, developing, evaluating and supporting the use of evidence-based practice, e.g. a nurse with a basic nursing degree and an advance expert nurse with a doctoral degree working in the same clinical setting will have very different responsibilities.

Changing and advancing roles is particularly relevant in a world where demographic trends and patterns of diseases are challenging health systems to redefine the scope of different health professions\textsuperscript{35}. Keeping up with community need and expectation requires commitment and active participation not only from policy makers but from all health professional groups, including nursing and midwifery. These roles need to be
adjusted or developed in line with the European policy framework *Health 2020*. For example roles should be adjusted to accommodate the transition from institutional to primary health and community based care settings. Similarly, with additional education, new roles can be developed for nursing and midwifery to improve access to health promotion, treatment, non-invasive care and surgical care. These roles should be explored and integrated in all relevant WHO technical programs. It is important that role development occurs in a planned manner within the context of clinical and regulatory standards, giving consideration to required competencies and supports.

### 4.2 Enabling mechanisms

In order to deliver the priority actions and meet the 12 objectives specific enabling mechanisms need to be in place. Four enabling mechanisms have been defined and are set out below. These are regulation, research, partnerships, and management and leadership. These are set out below linked specific objective/s where there is a direct relationship. The enablers of course also underpin other objectives.

#### 4.2.1 Regulation

*Regulation* is essential to ensure patient safety and quality care.

**Objective 9**: Ensure that the definition of nursing and of midwifery is enshrined in legislation and that mechanisms are in place to safeguard the public.

Regulation in nursing and midwifery must be in place for public protection and needs to encompass entry to practice, scope of practice and professional conduct. It is essential that Member States define regulatory framework in legislation (e.g. Nursing and Midwifery Act). This will include establishment and function of regulatory bodies that have the responsibility to maintain professional registers, set standards of entry to the profession, institute codes of conduct and make decisions of professional fitness to practice. A professional register is essential as a means to safeguard the public and a Code of Practice both guides the professions and sets out for the public expectations of a profession on the register. It is also important that the scope and authority of regulatory bodies extends to nurses and midwives working in enhanced roles, and as specialists and advanced practitioners.

Guidelines must be available for nurses, midwives and health sector stakeholders to define the standards of practice and disseminate best practice. Countries with such guidelines in place have been shown to have improved efficiency of care and improved health outcomes. In order to develop practice guidelines and audit in line with international quality assurance criteria, time and resources need to be devoted to enabling all disciplines to participate in this process. Nurses and midwives should be fully engaged in the process, providing professional expertise, research skills and leadership.
4.2.2 Research

Nursing and midwifery-based research is necessary both to develop the scientific knowledge base in the professions and to apply this knowledge to renew the practices in health care.

Objective 10: Build nursing, midwifery and multidisciplinary research capacity.

Establishing and developing nursing and midwifery research is an important way of understanding and improving health care delivery. Nurses and midwives need to undertake both research into nursing and midwifery care and research that brings a nursing and midwifery knowledge into understanding wider health care systems. Depending on the research design nursing and midwifery research can bring perspectives of front line workers and patients through to a nursing insight into whole system redesign. Both areas require growth in capacity. Research has the potential to improve and increase community/public confidence in nursing and midwifery care, and also to enhance the entire health system. It generates a richer source for evidence-based practice and a strong tradition of analytical skills.

It is equally important to promote research that provides a multidisciplinary approach including all health professionals. Practice that applies the best available findings in multidisciplinary research can introduce innovative ways of improving safety and promote evidence-based health care delivery. Such research can improve continuity of care for patients and ensure comprehensive care, thereby improving health outcomes. Additionally nursing and midwifery research should be used at national level to inform health strategy and policy.

As with any sound knowledge-based discipline it is important that nurses and midwives are in the position to lead, participate and inform research. To lead, post-graduate training is necessary. This, therefore, requires universities to develop appropriate programs, whilst also having government and health institutions fund such initiatives. Academic institutions can help too by providing opportunities for research career paths. Employers need to allocate time and resources, and also establish structures for nurses and midwives to participate and conduct research where appropriate alongside their practice.

Researchers in nursing and midwifery should also be engaged by policy makers to inform policy and research funding decisions. Governments should support health care services including community-based services that incorporate partnerships with nursing and midwifery-based and multidisciplinary research. As nurses participate in a diversity of areas and directly support delivery of care, nursing researchers can help governments develop targets and indicators on a variety of health issues. Similarly, midwives are integral players in sexual and reproductive health care. Research from both of these disciplines can only expand and enrich evidence for decision makers in government and non-government institutions.
4.2.3 Partnerships

Effective partnerships in health must integrate whole-of-government and whole-of-society approaches.

**Objective 11:** Build interdisciplinary and inter-sectoral collaboration and partnerships across society for developing and providing patient centered care.

Health challenges in Europe require new approaches and new relationships across government, between government and citizens and the wider community. Societies are reassessing the value of health and adopting approaches to support individuals to make healthier choices understanding that through these societies can become more productive. Nurses and midwives are important enablers of such approaches through their life-course approach to health promotion, which spans from a healthy start in life to healthy ageing.

In the health service setting partnership also exists by way of interdisciplinary collaboration. This involves an approach to patient care that engages multiple professionals with different functions as needed to ensure that various aspects of a patient’s physical, social and psychological needs are integrated and addressed. For this reason, an interdisciplinary approach leads to quality patient care, maximizing resources and facilities, and patient satisfaction.

For successful interdisciplinary collaboration to occur, team members must understand and respect each other’s credentials, scope of practice and function. The team must prioritize communication and learning between professionals. Interdisciplinary teams also shift leadership responsibilities as a case dictates. Leadership in an interdisciplinary team should be assigned to the most appropriate professional given the patient’s individual circumstance. This often requires a paradigm shift and involves delegation of responsibility and trust to professionals who traditionally may not have held leadership positions. In this way interdisciplinary teams are innovative and efficient.

Governments and institutions can support an interdisciplinary approach by identifying it as a necessary component when planning health targets and monitoring health service performance. For example, interdisciplinary education should be prioritized in all health professionals’ initial training and education. The interdisciplinary approach must then be continuously re-enforced in the workplace. In terms of expanding roles and making health care more efficient, interdisciplinary teams can inform the process of identifying the most appropriate roles for nurses and midwives. Wherever possible, institutions should devote research and project efforts to seek out opportunities of an interdisciplinary approach.

4.2.4 Management and Leadership

**Leadership** opportunities and **management** structures that engage nurses and midwives at all levels are essential to realize the full potential of nursing and midwifery workforce.

**Objective 12:** Strengthen nurses’ and midwives’ inclusion in health policy and service delivery decision making at local, government and international levels.
Nursing and midwifery need to develop capacities to engage in strong management and clinical leadership in order to perform at their highest standards. This requires adequate educational opportunities, leadership programmes and management structures at all levels.

Governments in all countries play a crucial role in assuring the adequacy of their health workforce through key functions including regulation, education, financing and health policy. Nurses and midwives must be included at this level of decision making because their expertise is vital for contributing towards the achievement of better health outcomes in their societies. Governments can achieve this by appointing chief nurses and midwives (GCNMs) to provide leadership for transforming health workforce and healthcare systems. GCNMs are crucial to improving health for all and decreasing health inequities through the development of nursing, midwifery and healthcare policy and action plans aligned to national health policy plans.

Organizations – whether academic, public or private benefit from embedding strong nursing and midwifery management and leadership in the organizational culture and management systems. Nurse and Midwifery leaders will ensure that nurses and midwives are competent and that they meet the requirements of safe, high-quality and evidence based care as well as contributing to corporate policy and service delivery. Supporting nurses and midwives in leadership roles is also as important for the sustainability and retention of these professional groups. Nurses and midwives in leadership roles bring clinical knowledge, experience of frontline care and ongoing connection to front line staff and patients to organizational decisions promoting high quality patient care.

5. IMPLEMENTING AND MONITORING OF THE EUROPEAN STRATEGIC DIRECTIONS

Ensuring the successful implementation of ESD is a priority of the WHO European Regional Office for Europe. The implementation is guided by a Plan of Work (see Appendix 1), which consists of 12 objectives associated with the four priority areas of action and the four enabling mechanisms. Each objective is aligned with activities for Members States and the Regional Office. Results will be monitored on the basis of defined indicators.

Member States are encouraged to use the Plan of Work as a guide for strengthening nursing and midwifery services within the context of their own country plans. National nursing and midwifery action plans, coordinated by GCNMs, can also be built on the Plan of Work. This will further guide the development of nursing and midwifery so that it is in line with ESD and Health 2020 and thus delivers both high quality patient care and best health outcomes for populations.

The implementation of ESD in Member States will be monitored through WHO nursing and midwifery country profiles. The profiles will define the baseline situation and national targets of nursing and midwifery. These profiles will be updated every five years and used as a tool for monitoring progress and development. By 2020, the progress and achievements in terms of the implementation of ESD will be assessed. Correspondingly, the progress of WHO activities defined by the Plan of Work will be reported to the Regional Director of the WHO Regional Office for Europe.

The Regional Office for Europe will also generate evidence on the contribution and impact of nurses and midwives through a European compendium of good nursing and midwifery practices. Information of the achievements and innovations will be disseminated and shared through learning opportunities, such as WHO workshops.
Furthermore, the Plan of Work defines mechanisms to engage Member States in the implementation of ESD in partnership with the WHO Regional Office for Europe and to mainstream nursing and midwifery across WHO technical programmes. Engagement of nurses and midwives will be facilitated through the establishment of WHO expert groups, such as a steering group of GCNMs for planning policies and expert groups for developing education and generating research evidence. Creating a platform of GCNMs, European Forum of National Midwifery Associations (EFNNMA), WHO Collaborating Centres and other experts of nursing and midwifery will provide further opportunities for the WHO Regional Office for Europe to request consultation whenever needed. For mainstreaming, new opportunities for nursing and midwifery leaders representing health policy, education and research should be identified to contribute to the WHO technical programmes.

*With the Member States’ support and commitment to implementing the European Strategic Directions, nurses and midwives can achieve a greater voice in national health policy and planning, and an enhanced role in improving health and well-being and reducing health inequities throughout the Region by 2020.*
Appendix 1: Four priority areas of action with the proposed action lines

Action area 1. Scaling up and transforming education

<table>
<thead>
<tr>
<th>Objective 1. Work to standardize Initial education of nurses and midwives at degree level to get best outcomes for patients and populations.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Responsible</td>
</tr>
</tbody>
</table>
| **Member State** | • Review and develop in line with WHO global standards for the initial education of professional nurses and midwives\(^7\):
  o academic level of initial nursing and midwifery education programmes
  o academic and clinical faculty or department arrangements
| Review and develop degree programmes and arrangements in line with principles of interprofessional education should be done. | Degree level programmes developed for initial nursing and midwifery education as outlined in WHO global standards for the initial education of professional nurses and midwives. | Percentage of institutions that have developed initial nursing and midwifery education:
  • at the degree-level
  • with academic and clinical faculty or department arrangements
  • with interprofessional education opportunities. |
| **WHO** | • Establish an expert group of selected GCNMs, Collaborating Centres for Nursing and Midwifery, nursing and midwifery experts and educators in order to guide education developments.
• Provide information and guidance on WHO global standards for the initial education of professional nurses and midwives and WHO framework for action on interprofessional education and collaborative practice in order to support activities in Member States as needed.
• Monitor progress of the development of degree programmes for initial nursing and midwifery education. | Development of interprofessional education opportunities during nursing and midwifery degree programmes. | • A working group with mentioned parties.
• Consultations initiated, followed up and reported on by WHO divisions to Regional Director regarding collaborations with the mentioned working group.
• Workshops and study visit opportunities organized to share strategies and experiences in the WHO European region.
• 5-year nursing and midwifery profiles include information on the development of degree programmes for initial nursing and midwifery education and interprofessional education opportunities. |
**Objective 2.** Develop education and regulation that enables and ensures nurses’ and midwives’ core competencies are in line with the basic principles of Health 2020:
- health promotion, disease prevention, patient education and empowerment of people
- management of chronic conditions and long-term care
- applying evidence based and safe practice
- working in multidisciplinary and intersectoral collaboration in line with the primary health care reform and principles of people-centred services.

<table>

<th>Indicators</th>
</tr>
</thead>
</table>
| **Member State** | • Ensure that undergraduate and postgraduate nursing and midwifery curricula include all of the components outlined in objective 2.  
• Identify the methods for evaluation of competencies outlined in objective 2. | Undergraduate and postgraduate curricula reviewed and appraised in terms of competency in responding to population needs, satisfying professional requirements and enabling people-centred services. | • Curricula include core competencies outlined in objective 2.  
• Methods identified to evaluate core competencies outlined in objective 2. |
| **WHO** | In collaboration with the working group on education developments:  
• update WHO Europe curricula for continuing education for nurses and midwives in line with Health 2020  
• compile and disseminate examples of strengthened competencies in nursing and midwifery education. | | • Updated WHO Europe curricula for continuing education for nurses and midwives available on the web.  
• Advice provided for Member States on areas of competency development based on lessons-learned from the European compendium. |
### Objective 3. Strengthen continuing professional development and career development.

## Action area 2. Workforce planning and optimizing skill mix

**Objective 4.** Develop workforce planning strategies and policies to ensure a sufficient and sustainable nursing and midwifery workforce.

<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| Member State | • Review and develop arrangements for health workforce forecasting, planning and monitoring based on national and international requirements.  
• Review and integrate distribution and retention policies as part of workforce strategies at all levels of government and institutions.  
• Review implementation of the *WHO Global Code of Practice for the International Recruitment of Health Personnel* where it pertains to nursing and midwifery. | Nursing and midwifery distribution, shortages and mobility accurately monitored and actively addressed. | • Accurate information available on demand, supply, stocks and mobility of nurses and midwives at country and sub-country levels.  
• Distribution and retention policies regarding nursing and midwifery workforce adopted at all levels of government and institutions.  
• The *WHO Global Code of Practice for the International Recruitment of Health Personnel* implemented and reviewed on an ongoing basis. |
| WHO | • Work with Member States, EU, and OECD to develop methodology, indicators, tools and strategies for workforce forecasting, planning and monitoring.  
• Disseminate the WHO tools and guidelines for human resources for health\(^\text{39}\). | | • Accurate information available on stocks, and mobility through the *Human Resources for Health databases*.  
• Workshops organized to disseminate information of WHO tools and guidelines. |
<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| **Member State** | • Assess and define the optimal mix of health personnel.  
• Ensure and monitor that there exists a balance between nurses, midwives and other health professionals as dictated by patient needs and contextual factors. | Appropriate mix of health personnel as defined by patient needs and contextual factors. | • Methods and parameters for assessing and monitoring the optimal mix of health personnel have been established.  
• Feedback mechanism(s) to ensure the balance between nurses, midwives and other health professionals. |
| **WHO** | • Work with Member States and EU to develop methods and parameters for assessing skill mix.  
• Provide opportunities for disseminating information and sharing experience between the countries and WHO technical programs. | | • Accurate information available on mix of health personnel in Member States through *Human Resources for Health databases*.  
• Workshops and a roster of experts organized to share experiences in the WHO European region. |
### Action area 3. Promote positive work environment

**Objective 6.** Promote positive work environments.

<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| **Member State** | - Apply the principles set out in the *ILO Nursing Personnel Convention 149*.  
- Ensure information is available that describes work environments in the interest of continuously improving working conditions through research and development.  
- Ensure nursing and midwifery basic education integrates healthy work environments.  
Review and develop action plans to improve working conditions, particularly in terms of:  
- staffing and workload balance  
- wages  
- security and flexibility of employment  
- safety of the work places  
- well-being at work  
- occupational hazards  
- violence in the workplace  
- age management. | Ensure positive work environment and job satisfaction maximizing the health and well-being of nurses and midwives while also improving health outcomes and organizational performance. | - Ratification of the ILO Nursing Personnel Convention 149.  
- Action plans to improve working conditions adopted at all administrative levels.  
- Accurate information available on healthy working environments by all health services.  
- Identify approach to integrate healthy work environment education into basic nursing and midwifery curricula. |
| **WHO** | - Provide technical support and disseminate information regarding legislation and mechanisms in relation to nursing and midwifery where requested, including the ILO Nursing Personnel Convention 149.  
- Disseminate WHO documents pertaining to healthy working environments. | | - Activities describing technical assistance to countries included in WHO divisions' annual report to Regional Director.  
- Workshops organized to disseminate information about healthy working environments. |
### Objective 7. Facilitate the culture of evidence based practice in nursing and midwifery.

<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| Member State | • Define and develop mechanisms within research, education, and management of health services to facilitate evidence based nursing and midwifery practice.  
• Generate evidence and key indicators to measure the impact of evidence-based care by nurses and midwives on health and performance outcomes. | Principles of evidence based care integrated and monitored across all nursing and midwifery practice thereby ensuring high quality, safe and effective health care. | • Policies and guidelines adopted by research, education and management of health services to support the development, application and dissemination of evidence based nursing and midwifery practice.  
• Percentage of health care institutions with quality management programmes and systems for monitoring safety and effectiveness of nursing and midwifery practice. |
| WHO | • Compile examples and share information on evidence-based nursing and midwifery practices in collaboration with the working groups.  
• Develop and include indicators in the WHO health for all database which reflect the relationship between nursing and midwifery contributions and health and performance outcomes. | | • Evidence-based nursing and midwifery practice compiled in a European compendium and available on the web.  
• Workshops organized to share information and experiences in the WHO European region.  
• Indicators available in the WHO health for all database. |
**Objective 8.** Develop, transform and adapt the roles of nurses and midwives in line with the Health 2020 goals.

<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| **Member State** | • Review and define a framework for the different roles of nurses and midwives including the roles of advanced practitioners and clinical experts.  
• Ensure that regulations are in place to protect these different roles.  
• Develop appropriate education in line with these roles. | Expanding the scope of practice for nurses and midwives in line with population needs, the life-course approach and health reforms. | • Framework defining different nursing and midwifery roles which reflects country needs.  
• Regulation defining different roles.  
• Undergraduate and postgraduate education programs developed for different roles in nursing and midwifery. |
| **WHO** | • Provide technical support and disseminate information on different roles for nurses and midwives in collaboration with the working groups.  
• Facilitate the integration of relevant nursing and midwifery roles into WHO technical programmes. | | • 5-year nursing and midwifery profiles include information on different roles of nurses and midwives.  
• Examples of different roles for nurses and midwives compiled in a European compendium and available on the web.  
• Workshops organized to share information and experiences in the WHO European region.  
• Assistance and activities included in technical programmes' annual reports to Regional Director. |
Appendix 2: **Four enabling mechanisms with the proposed action lines**

**Regulation**

**Objective 9.** Ensure that the definition of nursing and of midwifery is enshrined in legislation and that mechanisms are in place to safeguard the public.

<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| **Member State** | Ensure:  
- a register exists of nurses and midwives who have achieved the required level of competency  
- legislation is in place to define and regulate practice and conduct of nurses and midwives  
- a supervisory authority is in place to oversee the safety, quality and professional practice in nursing and midwifery  
- guidelines are developed to define standards of practice and best practice. |  
Professional act(s), registers, supervisory authorities and guidelines to ensure patient safety in relation to nurses and midwives. |  
- Register of nurses and midwives accessible by employers and the public to verify nurses' and midwives’ credentials.  
- Legislation to define and regulate practice and conduct of nurses and midwives.  
- Supervisory authority to oversee the safety, quality and professional practice in nursing and midwifery.  
- Guidelines to define standards of practice and best practice. |
| **WHO** | Provide technical support and disseminate information regarding legislation and mechanisms in relation to nursing and midwifery where requested. |  
5-year nursing and midwifery profiles include information on professional act(s), registers and guidelines to ensure patient safety.  
Assistance and activities included in annual reports by the Division of Health Systems and Public Health to the Regional Director.  
Examples of legislation and mechanisms in relation to nursing and midwifery compiled in a European compendium and available on the web. |
Objective 10. Build nursing, midwifery and multidisciplinary research capacity.

<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| Member State | Develop: | Improved opportunities and capacity for nursing, midwifery and multidisciplinary research leading to greater input into health policy decisions. | - Percentage of institutions with research-focused postgraduate programs.  
- Number of research publications and activities in nursing, midwifery and multidisciplinary research.  
- Increasing percentage of nurses and midwives participating and pursuing research activities and health policy work.  
- Partnerships between health care services and nursing, midwifery and/or multidisciplinary research programs.  
- Web-based portals for all health care professionals to guide evidence-based practice. |
| WHO | - Identify and disseminate evidence for the impact of good practices and nursing, midwifery and multidisciplinary research on health outcomes  
- Collaborate with WHO partners in the field of health systems research to address nursing and midwifery in their work. | | - Country case studies reviewed and compiled in a European compendium and available on the web.  
- Number of studies by WHO partner organizations that address nursing and midwifery research. |
**Objective 11.** Build interdisciplinary and inter-sectoral collaboration and partnerships across society for developing and providing patient centred care and improved health outcomes.

<table>

<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
<tbody>
<tr>
<td>Member State</td>
<td>Integrate nurses and midwives in developing and planning, managing and monitoring, and implementing integrated and coordinated patient centred care.</td>
<td>Interdisciplinary and intersectoral collaboration and partnerships ensuring integrated and coordinated patient centred care.</td>
<td>Research devoted to development of new types of partnerships for health across disciplines, sectors and society. Health targets and health performance reviews include partnership criteria. Policies and structures in place to facilitate and monitor partnerships. Interdisciplinary teams for providing patient-centred care. Innovative opportunities identified and implemented to promote learning between health professionals.</td>
</tr>
<tr>
<td>WHO</td>
<td>Provide opportunities for nursing and midwifery leaders to contribute to the development of education, research and health policy at the Regional Office or its Country Offices.</td>
<td></td>
<td>WHO programmes engaging nursing and midwifery expertise in education, research and health policy included in divisions' annual report to Regional Director.</td>
</tr>
</tbody>
</table>
### Management & Leadership

**Objective 12.** Strengthen nurses’ and midwives’ inclusion in health policy and service delivery decision making at local, government and international levels.

<table>
<thead>
<tr>
<th>Responsible</th>
<th>Activities</th>
<th>Expected results</th>
<th>Indicators</th>
</tr>
</thead>
</table>
| **Member State** | Ensure all levels of government and institutions:  
- appoint chief nurses and midwives  
- promote shared leadership with nurses and midwives  
- uphold the competency of nurses and midwives in government activities  
- engage nurses and midwives to implement health policy in their work. | Measures of shared leadership in place to ensure nurses and midwives actively participate in health policy development and service delivery. | • Appointment of nurses and midwives in senior management positions at all levels of government and institutions.  
• Agreed criteria on concrete means of promoting shared leadership.  
• Financial and training support available for nurses and midwives in these roles to develop their competencies in decision making.  
• National nursing and midwifery action plans in place; these must be coherent with and supportive of national health policy targets. |
| **WHO** | • Establish a steering group of GCNMs to advise the Regional Office in the strategic development of nursing and midwifery and the integration of these professions into WHO activities or technical programs.  
 • Develop a consultation platform (e.g. in-person meetings, web-based) for the GCNM steering group and Regional Office to include feedback from other GCNMs, EFNNMA and Network of Collaborating Centres for Nursing and Midwifery.  
 • Extend the number of Collaborating Centre for Nursing and Midwifery | • 5-year nursing and midwifery profiles include information on appointed GCNMs.  
 • Examples on shared leadership with nursing and midwifery compiled in a European compendium and available on the web.  
 • A GCNM steering group and consultation platform.  
 • Consultations initiated, followed up and reported on by WHO divisions to Regional Director regarding collaborations with the mentioned steering group and platform.  
 • Increased number of Collaborating Centre for Nursing and Midwifery |
